Earthschell Technologies — Complete Website Development Prompt

1. Project Overview

Build a complete, production-quality corporate website for **Earthschell Technologies**, an engineering and product development solutions company serving business clients and innovators.

Reference website: https://stamod.us/

Use the reference for inspiration around engineering-focused storytelling, strong typography, structured service sections, technical visuals, clear calls to action, and professional presentation. Do not copy its layout, text, logo, proprietary features, or branding.

Brand direction: Modern, minimal, technical, premium, trustworthy, international.

Primary objective: Convert visitors into qualified project enquiries by helping them understand the company's potential services, capabilities, and engagement process.

The website should feel like a thoughtfully designed engineering consultancy, not a generic software agency template.

2. Technology Stack

Use the following stack unless the existing project already has an appropriate working setup:

- Next.js with App Router
- TypeScript
- Tailwind CSS
- Lucide icons
- Reusable React components
- Next.js font optimisation
- Next.js image optimisation
- Vercel-compatible deployment

Use semantic HTML, maintainable components, clean file organisation, and reusable design tokens. Keep dependencies lightweight.

Before changing the existing project, inspect its files, dependencies, and current implementation. Preserve working functionality and avoid replacing the entire project unnecessarily.

3. Brand Identity and Design System

Colour palette

Use the colour direction inspired by the provided STAMOD reference screenshot.

- Deep Navy: `#0B1B2B`
- Dark Surface: `#10263B`
- Secondary Surface: `#162E43`
- Electric Cyan: `#00A6C8`
- Hover Cyan: `#19B8D5`
- Primary Light Background: `#F7F8FA`
- White: `#FFFFFF`
- Main Text: `#172433`
- Secondary Text: `#687787`
- Borders: `#DDE4EA`

Use navy and cyan as the main brand colours. Cyan should be an accent, not the background of every section.

Light and dark modes

Implement a complete, polished light/dark theme switch.

Light mode

- Off-white backgrounds
- White content surfaces
- Navy headings
- Dark readable body text
- Cyan buttons and selected accents
- Subtle grey borders

Dark mode

- Deep navy backgrounds
- Slightly lighter navy cards and navigation
- White or soft-grey headings
- Muted light-grey body text
- Cyan highlights and interactive elements
- Subtle borders with sufficient contrast

Requirements:

- Theme toggle in the desktop navigation and mobile menu.
- Use a sun/moon icon with an accessible label.

- Respect the visitor's operating-system preference on first visit.
- Persist the selected theme between visits.
- Avoid flashing the wrong theme during page load.
- Ensure every page, form, dropdown, footer, and interactive element supports both themes.
- Do not invert photographs or logos incorrectly.

Typography

Use a restrained modern font pairing, such as:

- Headings: Space Grotesk
- Body and interface: Inter

Use a clear hierarchy, comfortable line height, readable text sizes, and short paragraphs. Avoid oversized text that becomes awkward on mobile.

Visual principles

- Generous whitespace
- Precise alignment and consistent spacing
- Clean grid layouts
- Thin borders and restrained corner radii
- Strong visual hierarchy
- High-quality engineering, product design, CAD, machinery, and industrial imagery
- Subtle transitions and purposeful animations
- Minimal decorative gradients
- No excessive glassmorphism, floating shapes, or unnecessary animations
- No generic emoji-based service icons
- No horizontal overflow at any viewport width

Use the existing Earthschell logo asset provided to the project. Preserve its proportions and transparency. If it does not work on a particular background, create an appropriate CSS treatment or request a suitable alternate logo asset rather than redesigning the logo without approval.

4. Navigation and Global Layout

Create a clean responsive header with:

- Company logo
- Home
- Services
- Industries
- Projects
- About
- Contact

- Light/dark mode toggle
- A prominent “Discuss a Project” CTA

On desktop, use a compact navigation with consistent spacing.

On mobile:

- Use a hamburger menu.
- Provide a large, easy-to-tap menu.
- Close the menu after navigation.
- Prevent background scrolling when the menu is open.
- Keep the theme switch accessible.
- Ensure keyboard accessibility and visible focus states.

Create a reusable footer containing:

- Logo and short company description
- Main navigation
- Confirmed service links
- Contact CTA
- Location: Pimpri-Chinchwad, Pune, India — temporary location text; keep editable and replace with confirmed business details before launch
- Privacy Policy
- Terms and Conditions
- Copyright notice using the year 2026

Do not invent phone numbers, email addresses, social media links, registration details, certifications, client logos, or office addresses.

5. Homepage — /

Build the homepage as a carefully structured journey from understanding the company to submitting an enquiry.

Section 1: Hero

Use a clean two-column layout on desktop, with copy on the left and a relevant engineering/product visual on the right. Stack the content cleanly on mobile.

Suggested eyebrow:
ENGINEERING • PRODUCT DEVELOPMENT • SOLUTIONS

Headline:
Engineering Ideas Into Reality.

Supporting copy:
“From product concepts to complex engineering requirements, Earthschell Technologies

helps businesses explore the right expertise, technical capabilities, and development pathways for their projects."

Primary CTA: "Discuss Your Project"

Secondary CTA: "Explore Our Services"

Add a subtle visual using technical drawings, product forms, CAD-style geometry, or industrial photography. Keep it professional and avoid fake data dashboards.

All claims must accurately reflect the confirmed business model. Treat this copy as proposed wording pending business-owner approval.

Section 2: Introduction

Heading:
Engineering solutions, shaped around your needs.

Explain that different projects require different combinations of technical expertise, development capabilities, and manufacturing resources.

Keep the content concise and focus on understanding requirements and identifying an appropriate path forward.

Section 3: Services

Present three clean service cards.

Product Development

"Explore pathways for developing new products and improving existing concepts, from early requirements through appropriate design and development support."

Custom Engineering Solutions

"Identify engineering support and technical capabilities suited to specific project requirements and challenges."

Engineering & Manufacturing Coordination

"Explore suitable engineering specialists, service providers, and manufacturing resources based on the needs of a project."

Each card should include a restrained icon, a short description, and a "Learn More" link.

Only publish specific technical capabilities after confirmation from the business owner.

Section 4: How We Work

Heading:
A clearer path from requirement to solution.

Show four steps in a clean horizontal timeline on desktop and a vertical timeline on mobile.

1. Understand — Discuss the requirement, goals, and constraints.
2. Explore — Identify potential capabilities and resources.
3. Align — Discuss a suitable approach, responsibilities, and next steps.
4. Progress — Coordinate agreed activities and communication according to the engagement.

Do not promise project delivery, quality guarantees, turnaround times, or partner availability until confirmed.

Section 5: Industries

Use an elegant visual grid for proposed areas such as:

- Automotive
- Manufacturing and Industrial
- Product Innovation
- Engineering and Technical Services

Mark these as proposed categories during development. Publish only industries the company confirms it can support.

Section 6: Why Earthschell

Use a clean editorial layout rather than unsupported numerical statistics.

Potential themes:

- Requirement-led thinking
- Relevant technical expertise
- Flexible project approaches
- Clear communication
- Connections between requirements and suitable capabilities

Avoid claims such as “industry-leading,” “certified,” “lowest cost,” or “guaranteed delivery” unless supported by evidence and approved.

Section 7: Projects and Experience

Create a preview section for approved case studies.

Each case-study card should support:

- Project title

- Industry
- Challenge
- Approach
- Outcome
- Relevant visual

If no verified project information exists, use a restrained placeholder stating that project examples will be added after approval. Never invent clients, projects, results, or testimonials.

Section 8: Closing CTA

Heading:
Have a project in mind?

Copy:
“Tell us what you are working on. Share your requirements and start a conversation about possible next steps.”

Button: “Discuss Your Project”

6. Services — `/services`

Create a services overview page with a concise introduction and links to detailed service sections.

Product Development — `/services/product-development`

Include:

- What product development means
- Typical project needs
- Possible stages: concept, requirements, design, validation, and production planning
- How to discuss a project
- A relevant CTA

Clearly label specific technical services as subject to business confirmation.

Custom Engineering Solutions — `/services/custom-engineering`

Include:

- Project-specific engineering needs
- Requirement understanding
- Potential technical approaches
- Relevant specialist expertise where appropriate
- A clear enquiry CTA

Engineering & Manufacturing Coordination — `/services/engineering-manufacturing`

Include:

- Understanding project requirements
- Exploring suitable engineering or manufacturing capabilities
- Coordinating relevant discussions where agreed
- Clarifying project scope, responsibilities, and next steps

Do not imply that Earthschell owns factories, maintains a certified supplier network, or directly performs every service unless confirmed.

All detailed service pages should use the same structure, typography, spacing, and CTA patterns.

7. Industries — `/industries`

Create an overview page introducing the industries Earthschell may serve.

Proposed sections:

- Automotive
- Industrial and Manufacturing
- Product Development and Innovation
- Other confirmed sectors

For each industry, explain the kinds of problems or requirements that may arise and how a project discussion can help establish suitable next steps.

Do not invent technical specialisations or industry credentials. Hide unconfirmed industries from the public version until approved.

8. Projects — `/projects`

Build a responsive case-study gallery with optional industry filters.

Each project detail page should support:

- Project overview
- Client challenge
- Requirements and constraints
- Approach
- Confirmed services involved
- Outcomes, where measurable and approved
- Relevant images

- Related projects
- “Discuss a Similar Project” CTA

Use no fabricated portfolio content. If there are no approved projects yet, display a simple, professional message inviting visitors to discuss their requirements.

9. About — `/about`

Suggested heading:
Connecting engineering needs with practical possibilities.

Suggested introduction:
“Earthschell Technologies aims to help businesses and innovators navigate product development and engineering requirements by exploring relevant expertise, technical capabilities, and potential project resources.”

Sections:

- Company overview
- Our approach
- How we work
- Confirmed capabilities
- Leadership or team information, only when approved
- Contact CTA

Keep the tone factual, confident, and approachable. Do not invent founding dates, team sizes, years of experience, company history, or achievements.

10. Contact and Project Enquiry — `/contact`

This is one of the most important pages. Make it straightforward and reassuring.

Heading:
Let's discuss your project.

Supporting text:
“Share a little about your requirement. We can use the information to understand your needs and determine the appropriate next step.”

Create a responsive form with:

- Full name — required
- Work email — required
- Company or organisation — optional
- Country — optional
- Phone number — optional

- Project type — selectable list
- Industry — optional
- Estimated budget — optional; include “Not decided”
- Expected timeline — optional
- Project description — required
- Consent checkbox linking to the Privacy Policy — required where applicable

Project type options:

- Product Development
- Custom Engineering
- Manufacturing Coordination
- Other
- Not Sure Yet

Form behaviour:

- Validate required fields and email format.
- Display clear inline errors.
- Show a loading state during submission.
- Prevent accidental duplicate submissions.
- Display an accessible success confirmation.
- Display a helpful error message if submission fails.
- Include spam protection.
- Ensure the form works on mobile and with a keyboard.
- Deliver submissions to a configured company email or approved enquiry management service.

Do not simulate a successful submission if no backend integration exists. If configuration is missing, display a development-mode notice and document exactly what must be configured before launch.

Store secrets in environment variables. Never expose API keys or credentials in client-side code.

Use “Pimpri-Chinchwad, Pune, India” as temporary location text only. Keep the location, contact email, phone, and other business details configurable so they can be replaced easily.

Do not publish invented contact information or an unverified map pin.

11. Privacy Policy — `/privacy-policy`

Create a clear, readable draft page dated **24 October 2026**, subject to review and approval before publication.

Structure:

- Introduction and scope
- Information submitted through the contact form
- Information collected through website analytics, if enabled
- Purpose of processing
- How enquiries are handled
- Data sharing and service providers
- Data retention
- Security measures
- Cookies and analytics
- User rights and contact process
- Policy updates
- Contact details

Requirements:

- Do not claim analytics, cookies, tracking tools, or third-party integrations exist unless implemented.
- Do not make unsupported promises about data storage, deletion, or security.
- Use placeholders for the legal entity name, privacy contact, and final contact information until confirmed.
- Explain the actual data practices after implementation.
- Keep the page responsive and accessible in both themes.
- Include a last-updated date of 24 October 2026 as a draft date, not as proof of legal approval.

12. Terms and Conditions — `/terms-and-conditions`

Create a draft terms page dated **24 October 2026**, subject to business and legal review.

Structure:

- Introduction
- Website use
- Accuracy of website information
- Service descriptions and enquiries
- No automatic service agreement from submitting a form
- Intellectual property
- Third-party links and resources
- Limitation of liability, subject to applicable law
- Changes to the website or terms
- Governing law and jurisdiction — placeholder until confirmed
- Contact information

Do not invent a registered company name, jurisdiction, legal guarantees, or contractual commitments. Clearly mark unresolved details for review before publication.

These legal pages are initial drafts, not legal advice. Do not represent them as legally approved.

13. Responsive Design Requirements

Implement mobile-first responsive behaviour for:

- Small phones: approximately 320–375px
- Standard phones: 376–430px
- Tablets: 768px and above
- Laptops: 1024px and above
- Large desktop displays: 1440px and above

Check:

- No horizontal scrolling
- Correct text wrapping
- Responsive headings and spacing
- Single-column mobile hero layout
- Stacked cards on small screens
- Appropriate image cropping
- Full-width form fields on mobile
- Comfortable tap targets
- Working mobile navigation
- Readable footer layout
- Correct dark/light themes on all screens

Use fluid typography and responsive containers. Avoid fixed widths that break smaller screens.

14. Interactions and Motion

Add only useful interactions:

- Smooth but restrained section transitions
- Hover and focus states on links and buttons
- Subtle card interactions
- Mobile navigation animation
- Theme transition without flashing
- Accessible form feedback
- Optional restrained reveal animations

Respect `prefers-reduced-motion`. Do not let animation delay navigation or prevent content from being usable.

15. SEO and Accessibility

Implement:

- Unique page titles and meta descriptions
- Semantic headings in the correct order
- Descriptive URLs
- Open Graph metadata
- Favicon using the approved logo
- Sitemap and robots configuration
- Descriptive alt text for meaningful images
- Accessible labels for every form field
- Keyboard-accessible navigation and controls
- Visible focus indicators
- Adequate colour contrast in both themes
- Appropriate canonical URLs once the domain is confirmed

Do not add fake ratings, reviews, business locations, or structured data.

16. Performance and Quality

- Optimise images and use appropriate formats.
- Avoid unnecessary JavaScript and oversized dependencies.
- Prefer server components where interactivity is not needed.
- Use client components only for interactive features.
- Keep layout shifts minimal.
- Ensure all navigation links work.
- Add appropriate loading, error, empty, and success states.
- Do not leave broken buttons, dead links, or fake interactions.
- Do not include sample content that could accidentally appear as real company information.

17. Development Order

Implement in this order:

1. Inspect the existing project and logo asset.
2. Set up the design tokens, typography, global layout, and theme switching.
3. Build the responsive header, navigation, and footer.
4. Implement the homepage.
5. Build the services and service-detail pages.
6. Build the industries, projects, and about pages.
7. Build the contact page and configure enquiry delivery.
8. Create the Privacy Policy and Terms and Conditions drafts.
9. Add SEO, accessibility, performance, and error handling.
10. Test every page in light and dark modes across desktop, tablet, and mobile.

11. Resolve defects and prepare the project for deployment.

Use reusable components rather than duplicating page markup.

18. Acceptance Criteria

The website is ready for review when:

- All agreed pages are implemented.
- The design follows the navy, cyan, and neutral colour system.
- The logo is displayed correctly.
- Light and dark themes work across the entire website.
- The navigation works on desktop and mobile.
- All service and contact CTAs lead to the correct destinations.
- The enquiry form validates correctly and uses a real configured delivery mechanism.
- No company claims, statistics, testimonials, or project results are fabricated.
- Legal drafts and temporary business details are clearly identified for approval.
- Responsive layouts work without horizontal overflow.
- SEO metadata, accessibility basics, and performance checks are complete.
- The site can be deployed through the intended hosting workflow.

Final instruction: Build a cohesive, polished, fully responsive website with real navigation and working interactions. Prioritise clarity, credibility, maintainability, and a clean premium engineering aesthetic. Make sensible design decisions independently, but never invent company facts or claim an integration works before it has been configured and tested.
